No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

cDNA encoding muri

S S Result

This invention describes the isolation of a novel human B1 protein which can interact with, intracellular mediators or modulators of inflammation, cell death and/or cell survival pathways, directly or indirectly. Cells can be modulated or mediated in inflammation, cell death or cell survival pathways or another intracellular signalling activity using B1. Conditions such as AIDS and cancer can be treated using B1. Antibodies, oligonucleotides and ribozymes can also be used to regulate the above cancer treating AIDS, 90pp; English for 3B; Fig 4 Claim

C77607 to C78448 encode the human cancer associated proteins given in B43398 to B44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiinflammatory; antiasthmatic; antirherdic; antibacterial; antiviral; dermatological; antiapterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and vasotropic; antibodise, antibodises, and antiapoints from the present invention may be used to treat immune disorders by activating or invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of hamantopoletic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    medical

Claim 8; Fig 7b; 93pp; English.

This sequence encodes the human RICK (RIP-like interacting CLARP kinase)

C protein of the invention. The RICK protein acts as a positive regulator

C protein of the invention. The RICK protein acts as a positive regulator

C during CD95 signalling. The invention provides methods for identifying

apoptosis signalling pathway inhibitors and activators, and methods and

C compositions for screening compounds which will modulate the interactions

CC compositions compositions identified: ARC, RICK, and the CIDE family of

CC activators (CIDE-A, CIDE-B and DREP-1). RICK is useful in screening

assays for agents, useful in the diagnosis, prognosis or treatment of

disease associated with excess cell growth and dysregulation of

CC disease associated with excess cell growth and dysregulation of

CC disease associated with excess cell growth and dysregulation of

CC disease associated with excess cell growth and useful in Graph

CC apoptosis. Complexes containing RICK and CLARP can be used in drug

CC apoptosis. Overapression of ARC in an in vitro cell system can be used

CC identify inhibitors of the enzymatic activity of caspasae-8.

CC identification of ARC-like inhibitory compounds may be useful for gene

CC interapt reatment of disease with increased cell death in muscle tissue

CC can be used as reagents for the preparation or affinity chromatography

CC of an essential step in the blochemistry of apoptosis. A specific inhibitor

CC of an essential step in the blochemistry of apoptosis. A specific inhibitor

CC of an essential for apoptosis, inhibitors of RICK binding to intracellular

CC apoptosis factors are potential drug candidates.

The sequences were isolated from cDNA libraries prepared from various human tissues. The PHSP proteins are useful for the diagnosis, treatment and prevention of proliferative disorders, immune disorders and neuronal disorders. The PHSP proteins form pharmaceutical compositions which useful for treating or preventing disorders associated with decreased PHSP expression/activity. PHSP antagonists are useful for treating or preventing disorders associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Baughn MR;

This invention describes the isolation of novel human caspase
recruitment domain, CARD-3 and CARD-4 polynucleotides and proteins of
recruitment domain, CARD-3 and CARD-4 polynucleotides and proteins of
the invention are involved in the requisition of caspase activation.
The caspase recruitment domain (CARD) polynucleotides, polypeptides,
the chomologues and antibodies can be used in screening assays, detection
assays, predictive medicine and therapeutic and prophylactic methods of
treatment. The methods may be used to diagnose and treat patients which
complex, abnormal activity of the TNF receptor complex, or abnormal
complex, abnormal activity of the TNF receptor complex, or abnormal
complex, abnormal activity of the TNF receptor complex, or abnormal
complex, abnormal activity of the TNF receptor complex, or abnormal
complex, abnormal activity of the TNF receptor complex, or abnormal
complex, abnormal activity of the TNF receptor complex, or abnormal
complex, abnormal activity of the TNF receptor complex, or abnormal
complex, abnormal activity of the TNF receptor complex, or abnormal
complex, and hormone-dependent tumours), autoimmune disorders (e.g. or
systemic lupus erythematosis, immune-mediated with mutations
complex, and hormone-dependent tumours), autoimmune disorders (e.g. or
systemic lupus erythematosis, immune-mediated glomerollonephritis), viral
complex, and sended in interacts with other cellular proteins, and so
can be used for regulation of cellular proliferation and differentiation
and call survival. The CARD proteins may also be used to for screen drugs
correction, which modulate their activity. The CARD-4 gene can express a
concounted which modulate their activity and CARD-4 gene can express a
concounted which modulate their activity and cARD-4 splice and express a
concounted which modulate their activity and cARD-4 gene can express a
concounted which modulate their activity in the methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or two CARD-4 splice variants, CARD-4Y and CARD-4Z. This sequence the human CARD-3 protein described in the method of the

Sequences F21614 - F22031 represent DNA sequences encoding human proteins B58711 - B59128. The DNA and protein sequences are associated with breast and ovarian cancer. Included in the invention are sequences F22032 - F22040 and B59129 which are used in the isolation and craracterisation of the DNA and protein sequences of the invention. The breast and ovarian cancer associated DNA, protein, agonist or antagonist sequences exhibit cytostatic; immunosuppressive, nootropic; antiinflammatory; antiinles; immunosuppressive, nootropic; antiinflammatory; antiinles; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic and cardiant activity. The polynucleotide and protein sequences are used in the diagnosis of cancer, particularly breast and ovarian cancer. The nucleic acid sequences, proteins, agonists and agonists may also be used in the diagnosis, prevention and treatment of immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes multiple sclerosis, rheumatoid arthritis and ulcerative colitis; cardiovascular disorders such as myocardial ischaemats, wound healing; contrological and associated associated and associated and associated associated and associated associated associated associated and associated associated associated associated and associated as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New human breast and ovarian cancer associated gene sequences and the polypeptides encoded by these genes, useful in the prevention, treatment and diagnosis of cancer, immune disorders, cardiovascular disorders and neurological diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases such as cerebral anoxia and epilepsy; and

The invention provides polynucleotides which encode novel protein kinase homologs expressed in various human cells and tissues. The present sequence represents the clone 156108 cDNA fragment derived from a human cDNA library designated THP-1 phorbol LPS. The cDNA encodes a protein kinase which shows homology to the U01064 Dictyostellum Y kinase. Vectors and host cells can be used for recombinant production of the protein kinase homology. The recombinant proteins may be used to raise antibodies for use as anti-kinase therapeutics. Oligonucleotides based on the polynucleotide sequences, i.e. probes and antisense constructs, the peptides and antibodies are claimed to be useful as tools for studying signalling cascades in cells and proteins, and for identifying inhibitors (drugs) to treat diseases and inflammatory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 conditions associated with abnormal kinase expression. Diseases that are claimed to be treatable include human X-linked agammaglobulinaemia, nonspherocytic haemolytic anaemia, artherosclerosis, carcinomas, diabetes, gliomas, restenosis, cholera-based septic shock, etc.
                                                                                                                                                                                                                                                                                                                                                        Protein kinase; cell signalling; inflammation; carcinoma; diabetes; human X-linked agammaqidobulinaemia; nonspherocytic haemolytic anaemia; artherosclerosis; glioma; restenosis; cholera-based septic shock; U01064 Dictyostelium Y kinase; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to novel nucleic acid sequences derived from rat dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and transit amplifying cells. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate anglogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle discretes. Sequences Zeinford from all process derived from all and an account of the sequences derived from all and account of the sequences derived from all accounts are sequenced and and account of the sequences derived from all accounts and account of the sequences derived from all accounts and account of the sequences derived from all accounts and account of the sequences derived from all accounts and account of the sequences derived from all accounts and account of the sequences derived from all accounts and account of the sequences derived from account of the sequences and account of the sequences derived from account of the sequences derived from account of the sequence and account of the sequence of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       several mouse, rat or human skin cell types. Sequences 261606-261649, 261755-261765, 261802-261811 and 261826 encode proteins with an N-terminal signal sequence, indicating that the proteins are secreted. Sequences 261650-261668, 261766-261780, 261812-261817 and 261827-261829 encode proteins with one or more putative transmembrane domains.
                                                                                       1023
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        JG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             5
                                                                                                                                                                                                                                                                                               The present polynucleotide encodes a polypeptide which is expressed in mammalian skin cells. The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of

The present sequence encodes a murine death associated kinase protein, containing ankyrin repeats, designated DAKAR. The DAKAR polynucleotides can be used to express the polypeptides, and as probes to identify on ucleic acids encoding proteins having kinase activity. DAKAR polypeptides and fragmented polypeptides are used for purifying polypeptides and fragmented polypeptides are used for purifying proteins, e.g. to measure protein activity; as quality assurance agents to monitor shelf life and stability of binding partner proteins; as research agents, e.g. in assays to determine protein kinase activity, to identify novel molecules involved in signal transduction pathways, and to identify therapeutic compounds which may interfere with apoptosis; as molecular weight and isoelectric focusing markers; as controls for peptide fragmentation; identification of unknown proteins, controls for peptide fragmentation; identification of unknown proteins, and to purify the protein by immunoaffinity of the protein, and to purify the protein by immunoaffinity characteraphy. The antibodies can be used in assays to detect the presence of the protein, and to purify the protein by immunoaffinity characteraphy. The antibodies can also be used to block binding of the DAKAR polypeptides to their binding partners. Compounds that inhibit or enhance the kinase activity of DAKAR can be used to treat diseases

```

The invention relates to novel nucleic acid sequences derived from rat dermal papilla, human keratinocytes and neonatal foreskin fibroblasts, and mouse embryonic skin, keratinocyte stem cells and translat amplifying calls. Polypeptides of the invention may be used to treat inflammation, cancer and neurological diseases. The proteins may be used to stimulate the growth and motility of keratinocytes, to inhibit the growth of cancer cells, to modulate angiogenesis and tumour vascularisation, to modulate skin inflammation, to modulate epithelial cell growth and to inhibit binding of HIV-1 to leukocytes. The invention may also be used to treat growth and developmental defects, skin wounds and hair follicle disorders. Sequences Z61606-Z61802 represent cDNA sequences derived from several mouse, rat or human skin cell types. Sequences Z61606-Z61849, 261725-Z61765, Z61802-Z61811 and Z61826 encode proteins with an sequence, indicating that the proteins are secreted. Sequences Z61650-Z61668, Z61766-Z61810, Z61812-Z61817 and Z61812-Z61817.

The polypeptide is useful for stimulating keratinocyte growth and motility, inhibiting the growth of cancer cells, modulating angiogenesis, inhibiting angiogenesis and vascularisation of tumours, modulating skin inflammation, stimulating the growth of epithelial cells, inhibiting the binding of human immunodeficiency virus (HIV)-1 to leukocytes, and treating inflammatory disease, cancer and neurological diseases. The polynucleotide can be used as a marker, in the identification of genetic disorders, and for the design of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A single-stranded DNA (or its complementary strand or the corresp. Codouble-stranded DNA) which comprises one of the 7837 "6S" sequences given in T19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-end translated sequence is unique to a particular mRNA species, almost all the 3'-oriented comas hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Identifying gene signatures in 3'-directed human cDNA library for diagnosis of abnormal cell function, by preparing cDNA that reflects relative abundance of corresp. mRNA in specific human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

The present sequence is that of Genesis clone 971025TRAM004820HT

(Fel) DNA. The translation of the clone (frame 3) is provided in cry91s4. The polypeptide has kinase activity. The invention relates to purified murine polypeptides (see Y79152-56) that have kinase function and isolated nucleic acids encoding them (see CS5882-86). The nucleic acids can be used to express the polypeptides, as probes to identify nucleic acids encoding proteins polypeptides, as probes to identify nucleic acids encoding proteins having kinase activity, and in assays to identify chromosomes, map murine genes, and study tumours. Vectors comprisaing the novel nucleic acids and host cells (bacterial, yeast, plant, insect or animal) transfected or transduced with the vectors are claimed. The kinase polypeptides and their fragments are used as mol.wt. and isoelectric focusing markers, and as controls for peptide isoelectric focusing markers, and as controls for peptide kinases play a central role in cellular signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  330 tgagccgcgcgcctctggcactgtgtcgtccgcccgccacgcagactggcgcgtccagg 389

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The CTR1 gene was mapped to an interval between 2 RFLPs in chromosome 5 of A. thaliana and a chromosome walk in this area was initiated using a YAC library, 2 clones were isolated and used to probe a cDNA library derived from polyA RNA from 3 day-0ld dark-grown, ethylene-treated A. thaliana seedlings. The cDNA for the CTR1 gene is given in Q98816. Expression of the CTR1 gene in transgenic plants results in a dominant ethylene-insensitive

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score

Clone CTA-437L15 is from a release of the human BAC library
CITB-HS-A. The library contains cloned DNA from human sperm. See:
Shizuya et al., Proc. Natl. Acad. Sci. USA 89:8794-7 (1992); U-J.
Shizuya et al., Genomics 34:213-8 (1996). The clone is available from
Research Genetics, Inc. (http://www.resgen.com).
                                                                                                                                                                          the entire insert of this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note="serine/Threonine kinase RICK; match to protein AF027706 (PID:93123886); H_RG437L15.1"
                                                                                                                                                                                         clone sections once, or longer because we only sequence overlapping between neighboring data submissions.
                                                                                                                                                                                                                                                                                                             This sequence was finished as follows unless otherwise noted: all regions were double stranded or sequenced with an alternate chemistry; an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The clone sequenced to the left is CTA-237G1. The actual start of this clone is at base position 1 of CTA-437L15; actual end is at 116650 of CTA-437L15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This chromosome 8 clone was provided by Dr. Patrick Concannon (patcon@vmmc.org) at the Virginia Mason Research Institute.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This clone contains STS HS275YF1 (NID:g1051703).
